

Case scenario

Mr. J is a 46-year-old- with a long history of psychosis. The patient has refused to eat and take his medication for the last week. The patient states, “The food and medication have been contaminated by the spies.” The patient goes on to say... “God spoke to me and told me not to eat or take my medication because it is poisoned”. You notice that the patient does not show any emotion when he speaks, and his eyes are mostly looking at the floor. He has a strong body odor and his clothes are very dirty. He is very distracted, frequently stops talking and looks toward the end of the room with a frightened look on his face. The patient is diagnosed with Schizophrenia, Paranoid and treated with olanzapine, quetiapine, achenone and psychotherapy after discharge.

In the light of this situation answer the following questions:

1. Identify the psychiatric signs and symptoms from the above mentioned situation and **define each**?
2. List two nursing diagnoses for patient’s problems mentioned in the situation according to priority?
3. Develop the appropriate plan of action for each nursing diagnosis and select the most appropriate principles?
4. Mention the most appropriate recreational or vocational activities for the patient and **identify the objectives** of these activities?
5. Mention the medication group of “**olanzapine**” and its specific side effects?

Good luck
