

Case scenario

A 20-year-old boy brought to the outpatient clinic with his old brother. From his early childhood, he was exposed to aggressive behavior of his father, who often attempted to discipline him and in this pursuit at times was abusive and aggressive toward him. Last year he moved with his mother to his maternal grandparents' home and his school was changed. The mother often received complaints from school where the child was found engaged in fistfights and undesirable behavior. He also preferred solitary activities and resented to eat with the rest of the family. In addition, a decline in performance of daily routine activities was seen. He also started hearing voices that tell him that "***all are bad, fight them***". He suspected that family members including his mother collude with the unknown persons, whose voices he heard and believed it was done to tease him. He eventually dropped out of school and was often found awake until late night, seen speak to self, shouting at persons who were not around with further deterioration in his socialization and self-care. The patient asked to describe his mood, he answered, "My mood is always down."

In the light of this situation answer the following questions:

1. Identify the psychiatric signs and symptoms from the above mentioned situation and **define each**?
2. List the nursing diagnoses for patient's problems mentioned in the situation?
3. Apply the most appropriate principles with each nursing diagnosis?
4. Develop the appropriate plan of action for each nursing diagnosis?

5. Mention the most appropriate recreational or vocational activities for the patient and **identify the objectives** of these activities?
